

## **PhP + MySQL questions and possible answers**

**Edit Lázár**

During the education of programming we meet various problems. In my essay I want to show some problems and their possible solutions in PhP and MySQL. Today these two programs together make a very fast and useful complex on web-programming. I want to pay attention to the possible errors and failures what can programmers do writing a questionnaire-make program. I will make a process from the planning of software and database to the realize. I will give a list about problems, their possible solutions, if I know they, and the source where I found the solution (e.g. character-set using problems, random-procedure, etc.). I won't be able to enumerate all of problems and solutions but I intended to show a lot and I want to give some help to teachers, too.
